## Anti-Wrinkle Injections

### Botox®

Commonly known as 'Botox', botulinum toxin is a naturally occurring protein that causes temporary relaxation of muscles by blocking nerve signals, resulting in a reduction in fine lines and wrinkles. Botox can also be used to enhance facial features or treat conditions such as teeth-grinding (Bruxism) and excessive sweating (Hyperhidrosis). Typically, effects last 3-4 months, after which time the effects fully-resolve and follow-up treatments are recommended.

## Skin Rejuvenation

### Profilo®

Profilo, is an injectable skin rejuvenation treatment containing a high concentration of hyaluronic acid. This naturally occurring sugar found in the skin has an important role in maintaining skin hydration and volume. Profilo binds to water and stimulates production of new collagen, elastin and hyaluronic acid, which are essential for skin structure. The overall effect is skin tightening, lifting and moisturisation, giving a more youthful appearance. Profilo can be used in the face, neck, décolletage, hands and arms to treat skin laxity and improve skin quality. For optimal results, a full course of 2 treatments are strongly recommended, 4 weeks apart, with further treatments every 6-12 months thereafter.

## Wellness Booster

### Vitamin B12 Injections

Vitamin B12 injections can help improve overall wellness, boost energy levels and our immune system, and improve sleep and skin quality. Boosters are recommended every 2-3 months when supported by a healthy, balanced diet.

## Dermal Fillers

### Juvederm Vycross®

Dermal fillers contain hyaluronic acid, a naturally occurring sugar found in the skin. As we age, the amount of hyaluronic acid in the body reduces, resulting in visible signs of ageing. Fillers can be used to restore facial volume and treat deep skin depressions as well as fine lines and wrinkles. They can also be used to enhance facial contour, particularly of the lips or cheeks. Typically, effects last between 12 and 24 months, depending on the specific product used.

## Thread (Spider) Vein Treatment

### Sclerotherapy

Sclerotherapy is a popular treatment used to eliminate thread (aka spider) veins in the legs. A liquid medicine called a sclerosing agent is injected into the small superficial veins causing them to shrink and disappear over a few weeks. Between 1 and 4 treatment sessions (each 4-8 weeks apart) may be needed depending on the extent of thread veins being treated, however results are permanent.

## Fat Dissolving Injections

### Aqualyx®

Aqualyx is a safe and widely-used, permanent fat loss treatment. This injectable liquid is derived from cholanic acid, which is naturally produced by our liver to break down fat. It works by dissolving fat cells which are then removed by your immune system and liver. Aqualyx can be used almost anywhere to effectively treat stubborn fat deposits including the chin, neck, arms, stomach, waist, hips, thighs and back. Depending on the area, between 2 and 6 treatments may be required.
